Anton Florendo

Vancouver, BC | 778-927-5270 | antonflorendo7@gmail.com | linkedin.com/in/antonflorendo | github.com/aaf1007

Education

Simon Fraser University — Burnaby, BC
Bachelor of Science, Data Science — *Expected May 2028*

- Coursework: Data Structures & Algorithms, Software Engineering, Databases, Artificial Intelligence

Experience

Software Engineer Intern — Sep. 2026 – Present
SAP — *Vancouver, BC*

- Helped launch an AI documentation workspace that served 20,000 API requests on day one by shipping 30 Vue 3 features and fixes in 2 months, 25 of them backed by regression tests
- Designed a pure event reducer for AI agent runs (ordering, duplicate suppression, concurrent tool and sub-agent state, replay from history), backed by 22 new tests, after reading the Python (LangChain) and Java proxy source to pin down the event schema
- Eliminated list corruption in documentation search, verified by 47 unit tests, by replacing a regex over raw HTML with a TreeWalker and Range algorithm that splits matches at block boundaries
- Designing a backend service for admin-managed portal categories and page layout, defining the workflows, API contract and data model ahead of implementation in Java (Spring Boot)

Projects

grove | *Rust, Tokio, Tauri, React, TypeScript, GitHub Actions* — Oct. 2026 – Present

- Designed and built a macOS desktop app that runs parallel AI coding agents (Claude Code, Codex) in separate git worktrees, with a UI-agnostic Rust core exposing 55 commands to a React/TypeScript UI
- Kept slow or hidden terminal panels from stalling their agents by batching PTY output into 8 ms frames with acknowledgment-based backpressure (128 KiB pause and 32 KiB resume watermarks)
- Merged 96 PRs in 19 days with 1,011 passing tests by directing AI coding agents through 16 architecture decision records, review of every change and 3 GitHub Actions CI jobs on each PR

Syllabyss | *Next.js, PostgreSQL, TimescaleDB, LangGraph, Clerk, Docker* — Oct. 2026

- Built an AI platform that turns uploaded course materials into 6 study games through a Gemini structured-output pipeline, with a second verification pass confirming 98% of cited answer evidence
- Engineered a server-authoritative game engine with typo-tolerant SQL answer matching, streaming every guess into a TimescaleDB hypertable that drives real-time leaderboards through continuous aggregates

Solar Calculator & Recommendation System | *Spring Boot, Spring Security, PostgreSQL* — Apr. 2026

- Shipped a Dockerized full-stack solar charge-controller sizing tool to Xantrex across 3 Agile sprints; the client acquired the project and deployed it to their customer base
- Built a PostgreSQL-backed recommendation engine cross-referencing solar configurations against NEC constraints and a live product catalog, cutting manual sizing to one form submission

Leadership & Activities

Web Developer, SFU Student Energy Club — Dec. 2025 – Present
Simon Fraser University — *Burnaby, BC*

- Redesigned and maintain the club website in HTML, CSS, and JavaScript, shipping weekly updates with a team of 3 and marketing leads

Technical Skills

Languages: Java, TypeScript, JavaScript, Python, Rust, SQL

Frameworks & Libraries: React.js, Next.js, Vue.js, Pinia, Spring Boot, Express.js, Node.js, FastAPI, LangGraph, Tauri

Databases & Caching: PostgreSQL, MongoDB, Redis

Developer Tools: Git, GitHub Actions, Docker, Vitest, Vite, Jira, Vercel, Claude Code, Codex, Cursor
